

Java Exercise1

1. Create a project and class in eclipse. Print hello world
2. Use scanner class to read course name and if course name starts with J then display “Java Programming Available” to the user
3. Read any number between 1 to 4 from the user and print the number in words using nested if else. If the user enters anyother input then print invalid value
4. Check if a given number is odd or even number
5. Read the radius and print the area of a circle
6. Read year and check if the given year is a leap year
7. Display Subject Name based on room number. If the user enters 823 then display Java Programming , If the user enters 824 then display Python programming for any other input display Invalid input to the user
8. Get registration number(String) as input from the user. If the user entered registration number starting with 1 then say first year, if the user entered registration number starting with 2 then say second year,if the user entered registration number starting with 3 then say third year, if the user entered registration number starting with 4 then say final year ,for any other starting number display "Year not available"
9. Read a registration number from the user. If the third character in the registration number is a B then display “Welcome to Computer Science and Engineering School ” or else Display “You are not from Computer Science and Engineering School”
10. Read the following data from the user and print the same using a single Scanner class object
 - Name – String
 - RegNumber – int
 - City – String

11. Calculate and Display the area of a triangle by getting the input from the user
12. Write a Program that gets the value of a and b and checks the following rules
 - $(a + b) \bmod n = [(a \bmod n) + (b \bmod n)] \bmod n$
 - $(a - b) \bmod n = [(a \bmod n) - (b \bmod n)] \bmod n$
 - $(a \times b) \bmod n = [(a \bmod n) \times (b \bmod n)] \bmod n$
13. Take two numbers as input and check if the numbers are coprime numbers (Set of numbers that have GCD as 1 are called as Co-Prime Numbers, for instance 7 and 8 are coprime numbers)
14. Write a program to check if the sum of any two co-prime numbers is always co-prime with their product
15. Write a program to check if the number 153 is an Armstrong Number (A number is thought of as an Armstrong number if the sum of its own digits raised to the power number of digits gives the number itself.)
