

Activity-5

Design a product review form for an online store. The form should allow customers to provide feedback on their recent purchases, including ratings, comments, and optional information such as their location and age group. Additionally, implement validation to ensure that the rating provided is within the acceptable range and that all required fields are filled out before submission.

Instructions:

1. HTML Form Structure:

- Create an HTML form with appropriate fieldsets and legends for organizing different sections of the review form.
- Include input fields for customers to provide their product ID, Date purchased, name (optional), email address (optional), and age group (optional).
- Add radio buttons for customers to rate the product on a scale of 1 to 5 stars.
- Provide a textarea for customers to write their review comments.
- Include checkboxes for optional information such as location (e.g., country, city) and age group categories (e.g., under 18, 18-30, 30-45, over 45).

2. JavaScript Functionality:

- Implement JavaScript functions to validate the rating provided by the customer and ensure that it falls within the acceptable range (1 to 5 stars). If the rating for the product is ≤ 1 , then provide a fileupload option to get the image of the product.
- Check for the purchase date validity. If its greater than 2 weeks from current date alert the user to escalate
- Ensure the image file is within 1 MB and type of file.
- Ensure that all required fields are filled out before allowing form submission.
- Display appropriate error messages if any required fields are missing.

3. Styling and Presentation:

- Use CSS to style the form elements for better visual presentation and user experience.
- Ensure that the HTML code is well-structured and properly formatted for readability and maintainability.

4. Additional Considerations:

- Provide clear instructions and labels for each form field to guide customers through the review process.
- Consider adding a character count for the review comments to inform customers of the maximum allowed length.
- Incorporate visual cues to indicate required fields and highlight any errors or validation messages for a better user experience.
