

Block cipher Vs Stream Cipher

Module II

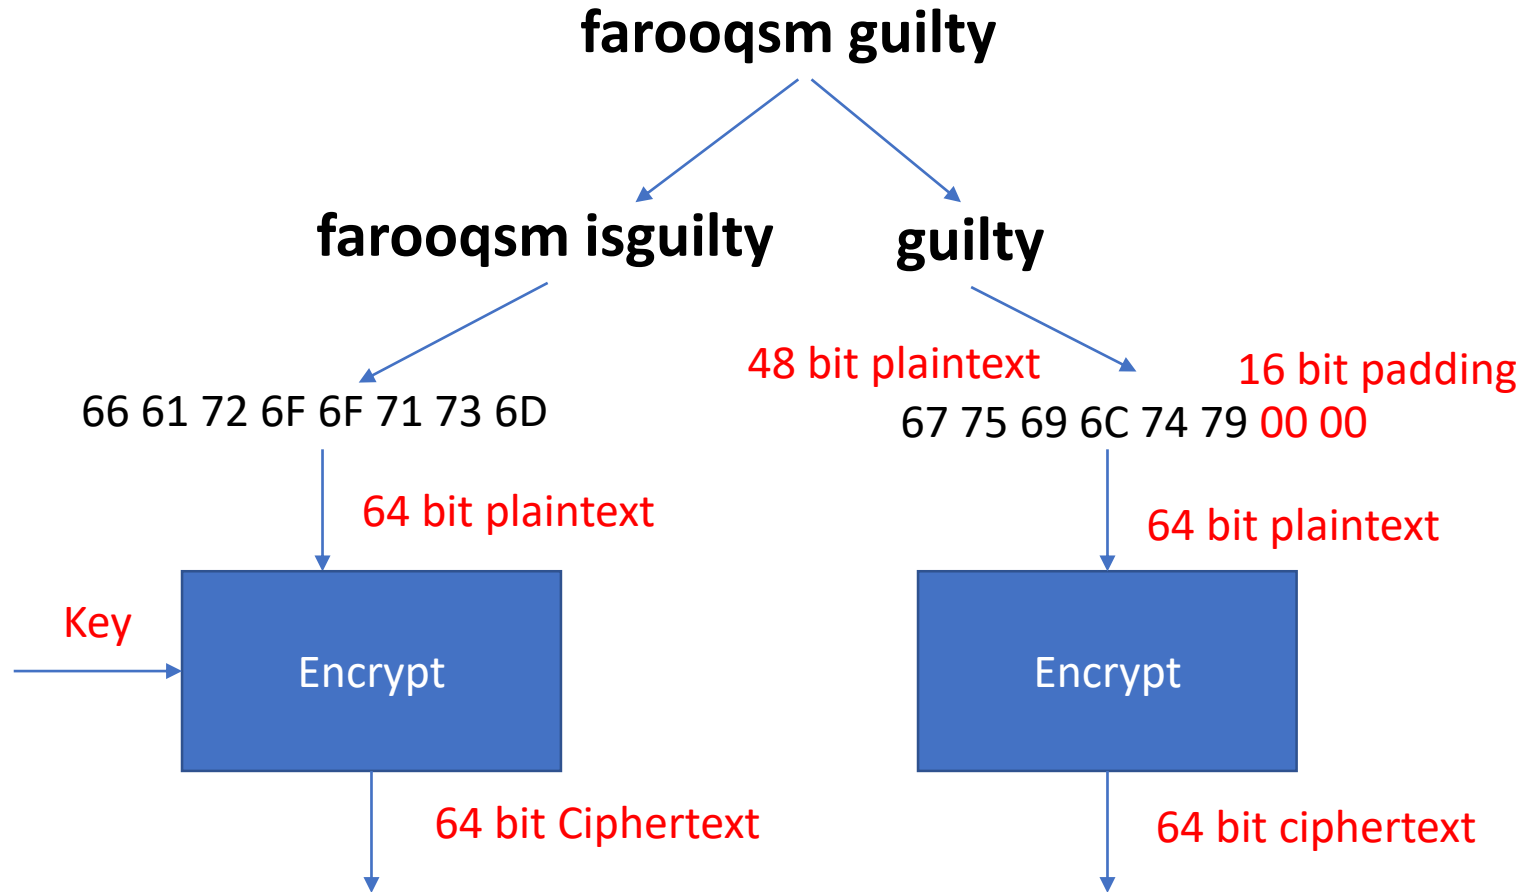

Block cipher

- A block cipher is an encryption/decryption scheme in which a block of plaintext is treated as a whole and used to produce a ciphertext block of equal length.

Block cipher

Block cipher padding

Stream Cipher

- A typical stream cipher encrypts plaintext **one byte at a time**, although a stream cipher may be designed to operate on one bit at a time or on units larger than a byte at a time.
- The primary advantage of a stream cipher is that stream cipher are almost always faster than use far less code than do block ciphers.

Stream cipher
