

$$R = \{ A, B, C, D, E \}$$

$$R_1 = \{ A, B, C \}$$

$$R_2 = \{ A, D, E \}$$

$$F = \{ A \rightarrow BC, CD \rightarrow E, B \rightarrow D, E \rightarrow A \}$$

	1	2	3	4	5
	A	B	C	D	E
AB C	a ₁	a ₂	a ₃	b ₁ 4	b ₁ 5
AD E	a ₁	b₁ 2 a ₂	b₁ 3 a ₃	a ₄	a ₅

$$A \rightarrow BC$$

$$a_1 \rightarrow a_2 a_3$$

$$a_1 \rightarrow \begin{matrix} \cancel{b_1 2} \\ a_2 \end{matrix} \begin{matrix} \cancel{b_1 3} \\ a_3 \end{matrix}$$

As the last row is made up entirely of 'a' symbol, the decomposition has lossless join property.
