

# **STRING MATCHING ALGORITHM**

## **MODULE-3**

# String Matching

- String Matching Algorithm is also called "**String Searching Algorithm.**" It Finds all occurrences of a pattern in a given text(or body of text).
- Given a text array,  $T [1.....n]$ , of  $n$  character and a pattern array,  $P [1.....m]$ , of  $m$  characters.
- The problems are to find an integer  $s$ , called **valid shift** where  $0 \leq s < n-m$  and  $T [s+1.....s+m] = P [1.....m]$ .
- In other words, to find whether  $P$  in  $T$ , where  $P$  is a substring of  $T$ . The item of  $P$  and  $T$  are character drawn from some finite alphabet such as  $\{0, 1\}$  or  $\{A, B .....Z, a, b..... z\}$ .

# **Algorithms used for String Matching**

There are different method to find the string matching

- The Naive String Matching Algorithm
- The Rabin-Karp-Algorithm
- The Knuth-Morris-Pratt Algorithm(KMP)

# The Naive String Matching Algorithm

The naïve approach tests all the possible placement of **Pattern P** [1.....m] **relative to text T** [1.....n]. We try shift  $s = 0, 1, \dots, n-m$ , successively and for each shift  $s$ . Compare  $T[s+1 \dots s+m]$  to  $P[1 \dots m]$ .

The naïve algorithm **finds all valid shifts** using a loop that checks the condition  $P[1 \dots m] = T[s+1 \dots s+m]$  for each of the  $n - m + 1$  possible value of  $s$ .

## NAIVE-STRING-MATCHER (T, P)

1.  $n \leftarrow \text{length}[T]$  //Text
2.  $m \leftarrow \text{length}[P]$  //Pattern
3. for  $s \leftarrow 0$  to  $n - m$
4.     do if  $P[1 \dots m] = T[s + 1 \dots s + m]$
5.         then print "Pattern occurs with shift"  $s$

**Analysis:** This for loop from 3 to 5 executes for  $n-m + 1$  (we need at least  $m$  characters at the end) times and in iteration we are doing  $m$  comparisons. So the total complexity is  $O[(n-m+1)*m] \rightarrow O(nm)$ .

# Time Complexity

## Analysis:

- This for loop from 3 to 5 executes for  $n-m + 1$  (we need at least  $m$  characters at the end) times and in iteration we are doing  $m$  comparisons. So the total complexity is  $O[(n-m+1)*m] \rightarrow O(nm)$ .

**Example:** The text and pattern is given below and find the index value at which pattern matched with text.

text : a b c d e a b f g f

pattern : e a b

- Step 1 :**    a b c d e a b f g h  
              e a b                    ...pattern is not matched.
- Step 2 :**    a b c d e a b f g h  
              e a b                    ...pattern is not matched.
- Step 3 :**    a b c d e a b f g h  
              e a b                    ...pattern is not matched.
- Step 4 :**    a b c d e a b f g h  
              e a b                    ...pattern is not matched.
- Step 4 :**    a b c d e a b f g h  
              e a b                    ...pattern is matched.
