

Module1 Lec 5

Functional components of a computer

Input Unit

Mouse

Keyboard

Joystick

Light Pen

Touch Pad

Microphone

Track Ball

Scanner

Digital Camera

Memory – Physical Device to store programs or data

- This memory is of two fundamental types:
 - Main memory (Primary Memory)
 - Volatile – loses information when power is removed.
 - Main Storage
 - Secondary memory.
 - Non-volatile
 - Secondary or Mass Storage

Main Memory

- Closely connected to the processor.
- Stored data are quickly and easily changed.
- Holds the programs and data that the processor is actively working with.
- Interacts with the processor millions of times per second.
- Needs constant electric power to keep its information.
- Fast
- Expensive
- Low Capacity
- Works directly with the processor

Main Memory

ROM

RAM

Secondary Memory

- Connected to main memory through the bus and a controller.
- Stored data are easily changed, but changes are slow compared to main memory.
- Used for long-term storage of programs and data.
- Before data and programs can be used, they must be copied from secondary memory into main memory.
- Does not need electric power to keep its information.
- Slow
- Cheap
- Large Capacity
- Not connected directly to the processor

Secondary Memory

Output Devices

Webcam

Webcam

Speakers

Microphone

Monitor

Printer

Printer

Headphone

CPU – Central Processing Unit

A *central processing unit (CPU)* is the electronic circuitry within a computer that carries out the instructions of a computer program by performing the basic arithmetic, logical, control and input/output (I/O) operations specified by the instructions
